Author : Vagapov, R. D., Dimentberg, F. M. and Serensen, S. V., Moscow

Title : Questions on the dynamic strength of turbogenerator rotors

Periodical : Izv. AN SSSR, Otd. Tekh. Nauk 9, 65-106, Sep 55

Abstract : Summarizes the results of experiments conducted in the Laboratory of Dynamic Strength, Institute of Machine Science, Acad Sci USSR. Studies the vibration stress in rotors operated at over 3000 rpm. Presents information on stress distribution in those parts of the rotor under greatest dynamic stress. Discusses rotor strength under the action of cyclic stress. Graphs, tables, diagrams, formulae. Twenty six references, 18 USSR.

Opredeleniye napryazheniy v opasnykh secheniyakh detaley slozhnoy formy; metod neploskikh secheniy (Determination of Stresses in Critical Sections of Members of Complex Forms; Method of Nonplane Sections) Moscow, Mashgiz, 1958. 146 p. 3,000 copies printed.

Reviewer: Vagapov, R.D., Candidate of Technical Sciences; Ed.: Preyss, A.K., Candidate of Technical Sciences; Ed. of Publishing House: Korableva, R.M., Engineer; Tech. Ed.: Model', B.I.; Managing Ed. for literature on general technical and transport machine building (Mashgiz): Ponomareva, K.A., Engineer.

PURPOSE: This book is intended for design engineers, scientific workers and students.

COVERAGE: The book contains a description of an approximate method of stress analysis in critical sections of complex components. The method is based

Card 1/6

Determination of Stresses in Critical Sections (Cont.) 800

on the nonplane (angular, cylindrical, spherical) section hypothesis. Analytical formulas are given for the determination of stress concentration factors for flat, rectangular, and circular bars of variable cross section subjected to tension, flexure and torsion. Results are presented of an experimental study of stress distribution in samples of variable sections having different dimension ratios. Illustrative examples of the analysis of bending and tension of a flat plate having symmetrical and asymmetrical cutouts and shoulders are given and examples of tension, torsion, and bending of a shaft with cutouts and shoulders are also presented. There are 29 references, of which 24 are Soviet, 3 are English and 2 are German.

AUTHOR: Vagapov, R. D. (Moscow)

TITLE: On the Durability of Large Scale Components Determined from Tests of Model Samples (K opredeleniyu dolgovechnosti krupnogabaritnykh detaley po rezul'tatam ispytaniy model'nykh obraztsov)

PERIODICAL: Izvestiya Akademii nauk SSSR, Otdeleniye tekhnicheskikh nauk, Mekhanika i mashinostroyeniye, 1959, Nr 1, pp 119-121 (USSR)

ABSTRACT: The durability of a large machine component during a cycle N and endurance σ can be expressed by a curve calculated from Eq.(1.1) where m and N_0 are the parameters (Ref.1). It was found that the endurance decreases with an increase of diameter of the model component which is shown in the table on p 119, based on the experimental data ($K_d = \sigma_{50}/\sigma_{7.5}$ - the endurance ratio of the models with diameter $d = 50$ and $d = 7.5$ mm for a given durability $\log N$) (Fig.8 in Ref.8). As the value of K_d is practically unaffected by durability, it can be calculated from statistical data based on a relationship of dimension and structural strength. The models of various depths of the cut ρ (Fig.1) made of the same piece Card 1/3 of metal, were subjected to bending tests. The diameter was

SOV/179-59-1-16/36

On the Durability of Large Scale Components Determined from Tests of Model Samples

kept constant ($d = 50$ mm or $d^* = 12.5$ mm, $\rho = 9, 7.5, 5, 3.5, 2, 1, 0.5$ mm). The concentration of tension extended from $\alpha_\sigma = 1.62$ to $\alpha_\sigma = 5.25$. The results are shown in Fig.2, where the higher curve represents a final destruction and the lower curve represents the starting point of the fracture formation (continuous line - $d = 50$, dotted line - $d^* = 12.5$ mm, 1 - appearance of fracture, 2 - fracture without destruction, 3 - destruction occurred, 4 - calculated values for a/ρ , α_σ , ρ , and ρ^* as shown separately in the diagrams 'a, b and v). The slopes of both curves are parallel due to $\log N_r - \log N_t \approx \text{const}$, i.e. N_r/N_t is not affected by the load σ but it increases when ρ decreases (N_r - number of cycles to the point of destruction, N_t - number of cycles to the point of fracture). The relationship of N_r/N_t and ρ is illustrated in Fig.3, where the curve 1 represents the

Card 2/3

SOV/179-59-1-16/36

On the Durability of Large Scale Components Determined from Tests of Model Samples

model with $d = 50$ mm and the curve 2 - $d^* = 12.5$ mm. In order to compare the slopes, the curves of Fig.2 were plotted together in Fig.4, where the continuous lines indicate the formation of fracture, the dotted lines - the destruction (both for $d = 50$ mm). The curves of destruction can be described by the formula $N_r = \varphi(\sigma) + \psi(Q)$, where $\varphi(\sigma)$ - fracture curve based on Eq.(1.1), $\psi(Q)$ - number of cycles with load Q before occurrence of destruction. There are slight variations in results obtained for the actual components and their models. These can be expressed as in Eq.(3.1) where an asterisk indicates the value for models (σ - mean durability). The value of endurance could be expressed as Eq.(3.2). There are 4 figures, 1 table and 3 Soviet references.

B134/B206

AUTHORS: Vagapov, R. D., and Fridman, Ya. B.

TITLE: Effect of the type of load on the fatigue strength

PERIODICAL: Zavodskaya laboratoriya, v. 27, no. 2, 1961, 183-188

TEXT: The effect of the type of load must be considered in mechanical tests of solids as well as in an evaluation of the durability of structures containing cracks and being stressed (Ref. 4). After the appearance of cracks it is necessary to change the working regime for the test of massive samples on resonance machines, in order to obtain total failure, so that in most cases the conditions leading to failure cannot be defined exactly. The strength of structural elements can be evaluated best when notched samples are used and the loading process takes place in two stages, i.e., up to the formation of cracks and ~~the~~ crack development. For constant load amplitude the following holds: $N_r = \psi(\sigma) + \psi(Q)$ (1) (N_r - number of loading cycles up to destruction, $\psi(\sigma) = N_t$ - curve drawn after the first macro-crack, where $\psi(Q) = N_r - N_t$, σ - the amplitude of mean stress at constant

Card 1/4

S/032/61/027/002/013/026
B134/B206

Effect of the type ...

load amplitude Q). For a given deformation amplitude ε , and given displacement v , respectively, the following holds: $N_r = \gamma(\varepsilon) + \gamma[Q(N)]$ (2), $\gamma(\varepsilon) = N_t$ denoting the strength for $\varepsilon = \text{constant}$, and $\gamma[Q(N)] = N_r - N_t$ the destruction time for $v = \text{constant}$. In the present case, fatigue strength and breaking strength were compared under equal conditions according to the curves $N_t = f(\sigma)$ and $N_r = f(\sigma)$ for two types of loading. Loading was carried out for a given amplitude of the bending moment through pure bending at a rotation of the sample (Fig. 1). The comparative tests for a given flexure amplitude v were made on the same machine by fixing the flexure, so that the initial load was equal in both cases. Smooth samples (diameter $d = 7.5 \text{ mm}$) of rolled steel of the type 45 were tested, and the results were compared for two loading levels 34 and 48 kg/mm^2 (Fig. 2, black circles: destruction at given amplitude of the bending moment M , white circles: at given flexure v). The measured values coincide for $\sigma = 34 \text{ kg/mm}^2$, while for $\sigma = 48 \text{ kg/mm}^2$ the durability is twice as high for $v = \text{constant}$ as for $M = \text{constant}$. Further 250 samples were tested at 34, 43, and 48 kg/mm^2 , as well as samples with stress concentration (through notches). The experimental results show that the durability must be evaluated after

B 134 /B206

Effect of the type ...

the appearance of cracks, and the strength conditions must also be studied further, as well as the conditions of destruction for given displacement. The tests must be made in two stages, i.e., up to crack formation and up to destruction. There are 6 figures and 14 references! 11 Soviet-bloc and 3 non-Soviet-bloc.

ACCESSION NR: AP4039255

AUTHOR: Vagapov, R. D.

TITLE: A method of evaluating fatigue strength by dividing cyclic load process into two stages

SOURCE: Zavodskaya laboratoriya, v. 30, no. 6, 1964, 733-738

TOPIC TAGS: cyclic loading, fatigue strength, microdefect, surface crack

ABSTRACT: The necessity of using a two-stage cyclic loading system for obtaining more complete information on fatigue failures is discussed. The two stages constitute: 1) formations of microdefects scattered throughout the volume of the specimen and of large surface cracks; 2) fatigue failure of the specimen along major crack. The problem is solved analytically for N loading cycles by the correlations $(K_0)_v = \sigma_a / \sigma_r$; $(K_0)_s = \sigma_a / \sigma_r$, where σ_a , σ_t , σ_r are nominal endurance limits of the unnotched specimen, of the notched specimen with large defects, and with fractures, respectively. The two-stage cyclic loading is shown schematically in Fig. 1 of the Enclosure, where Q_a = a given stress amplitude, V_a = a given displacement amplitude. It is shown that σ_a -N representation of fatigue curves is only conditional because,

Card 1/3

ACCESSION NR: AP4039255

during the first stage loading, one parameter remains constant while the other appears as a function of N. Moreover, during the second stage (when cracks develop), $\sigma = Q/W$ does not represent the average stress but is a parameter proportional to the load. Vibration relaxation and vibration creep curves represented as functions of N show clearly the nonlinearity of the microdefect accumulation with the increasing N. Orig. art. has: 7 figures and 2 formulas.

TITLE: Conversion of dispersion of fatigue strength characteristics (statistical theory and its limitations) 18

SOURCE: Mashinovedeniye, no. 4, 1965, 78-92

TOPIC TAGS: fatigue strength, distribution function, material fracture

ABSTRACT: The article is a report which was presented at the Conference on Statistical Methods of Estimating Strength in Machine Building, Leningrad, March-April 1966. The

author establishes correlations between the probabilities of damage by the first fatigue macrocrack in the case of bodies of diverse geometry subjected to various loads. For the limiting case where a macrocrack forms on the surface, formulas are given for fatigue strength distribution functions of the body in relation to its shape, size and manner of loading. For brevity and convenience of analysis of experimental distributions, the article derives conversion factors characterizing the correlation between damage probabilities for bodies of diverse geometry subjected to various loads. Instances are given for cases when these factors depend on the stress amplitude level in the dangerous point of a body. The theoretical results are based on the statistical ideas concerning the brittle fracture of macroscopically inhomogeneous bodies, formulated in 1933 by A. P. Aleksandrov and S. N. Zhurkov and

ACC NR: AP6017760

used by W. Weibull, and then by T. A. Kontorova and Ya. M. Frenkel', to predict scale effect according to mean strength values. The article compares the theoretical results with an experiment on steel specimens of various shapes and sizes and, on the basis of the comparison, draws conclusions as to the limits of the theory's applicability. Orig. art. has: 11 figures and 25 formulas. [JPRS]

TITLE: A method for obtaining polyphosphites. Class 39, No. 175655

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 20, 1965, 66

TOPIC TAGS: phosphorus compound, alkyl, aryl, phenol, xylene, nitrogen

ABSTRACT: This Author Certificate presents a method for obtaining polyphosphites by polycondensation of alkyl(aryl)dichlorophosphites and diphenols. To simplify the technique of obtaining the above compounds, polycondensation is conducted in a xylene solution. Nitrogen is constantly blown through the reacting mass during its polycondensation.

Title : On Innervation of the Pancreas by the Nervus Vagus

Orig Pub : Tr. Karagandinsk. med. in-ta, 1957, No. 2, 145-147

Abstract : In 12 experiments on cats, subdiaphragmatic cutting of the nervus vagus (NV) was performed. It was established that both NV, in the chest region, repeatedly exchange their fibers. By cutting of the right, as well as the left, NV a considerable number of degenerating nerve bundles is discovered in the pancreas. All of the nerve bundles in the gland are mixed - formed by the small branches of the sympathetic trunk and fibers of NV. There are direct branches of NV to the pancreas (bypassing the solar plexus).

Determination of small amounts of arsenic by reduction with metals. M. T. Kozlovskii, R. Z. Vagapova, and N. N. Zaslavskaya (Kashan State Univ.). *Zhurnal Khim. Fiz.* 33, 540-54 (1957).—Reduction of an arsenical salt, AsH_3 , with Na amalgam does not give a 100% yield of AsH_3 , but the results are nearly constant, and are more constant than when Zn is used. Reduction of As^{+3} with Na amalgam in acid and alk. solns. gives approx. the same results. As^{+3} is reduced in acid solns. as well as As^{+5} but in alk. solns. As^{+5} cannot be reduced by amalgam or by Al. The yield of AsH_3 increases only insignificantly with rising temp. and with increasing concn. of the amalgam. Addition of dextrin, $SnCl_2$, and phosphoric acid does not increase yield of AsH_3 during reduction with Na amalgam; salts of Fe decrease the yield considerably and salts of Cu appreciably. B. Z. Kamich

"Museological Embedding of Sensitive Biological Preparations into Polyester Synthetic Resins."

Budapest, Biologiai Közlemenyek, Vol 10, No 2, 62, pp 147-149.

Abstract: [Authors' English summary] Polyester-type synthetic resins can be made suitable for embedding sensitive biological preparations by the use of a new method. Earlier procedures, owing to the detrimental effects of dehydration, the water released from non-dehydrated preparations, and the high temperatures accompanying polymerization, did not prove to be satisfactory. The new method circumvents dehydration and uses color-proof fixing procedures. The extracellular water content in the surface portions of the preparation is reduced by monomeric treatment. The thermal effect of polymerization is prevented from affecting the biological substance by preliminary polymerization performed to an extent of 80 % outside the mould. Of 7 references, 3 are Hungarian, the rest Western.

63. Determination of the hydraulic efficiency of settling tanks - L. Musckalny, L. Vagda. (Hidrologia Kozlony - Vol. 35, 1954, No. 11-12, pp. 461-473, 22 figs., 1 tab.)

GP
①

No agreement has yet been reached in domestic and foreign literature on a standard method of hydraulic investigation of settling tanks and on the determination of the characteristics of efficient operation. The authors conducted experiments on models of horizontal flow settling tanks at the University of Building Sciences in Budapest. At the outset of the experiments attempts were made to interpret and calculate the hydraulic efficiency by applying the concept of the flow wave already employed abroad. The flow wave was experimentally determined by pouring a tracer solution (aqueous solution of a salt or dye) into the feed pipe of the settling tank for a short time and by plotting against time the change of the concentration of the tracer solution on the basis of samples taken from the discharge pipe of the basin. Since the experiments had shown that the wave pattern depended not only on the parameters of the flow taking place in the basin but also on the feed time as well, the authors also made a theoretical investigation of the rules governing the progress of the tracer solution. Theoretical considerations showed that there is a similitude between the curves of the flow wave and of the characteristics of the basin. From this follows that the tracer solution must be fed not only for a few seconds but for at least until the flow across the entire cross section, where the samples are taken, carries a uniform amount of

1214. Végté, L. Measurement of flow of small rivers with salting (in Hungarian), *Hidrologiai Közlöny* 35, 5/6, 202-200, May/June 1955.

Paper presents a thorough discussion of the determination of the volume rate of flow of small rivers with salting method. The basic physical or chemical aspects are not discussed; emphasized are the techniques, limitations, and instrumentations. From the principles of continuity of the rate of flow weighed with the salt concentrations, equations are derived for the time needed to introduce the solution, for the amount of the solution to be used, and for the distance between input point and measurement point. The application of these equations requires preliminary measurements.

Note that the paper discusses the use of salt concentration measurements in order to determine the volume rate of flow, and not the so-called salt-velocity method [*Trans. ASME* 45, p. 285, 1923].

Settling Tank

Orig Pub: Hidrol. kozl., 1956, 36, No 5-6, 374-384

Abstract: Model studies were made of the effect of the design of the water distributing devices, on the operation of a horizontal settling tank. The coefficient of utilization of the holding capacity of the tank was found to be as follows: 0.246 on weir-distribution of the water; 0.414-0.432 on a distribution of the water by means of perforated partitions; 0.850 on distribution of the water
